

mtg-liquidity-signal: the Current Liquidity index

Snapshot 2026-07-12. By Cameraderie Cards. Informational only, not financial advice.

Every existing model in this toolkit tells you *direction*: will a card rise (buy), has it peaked (sell), is it about to be reprinted (brace). None of them tells you whether you can actually **exit**. A perfect sell call is worthless on a card that takes months to move and only at a deep discount. This model fills that gap. It assigns every Magic: The Gathering card a **Current Liquidity** score from 0 to 100: how easily an owner could turn it into cash right now.

What goes into the score

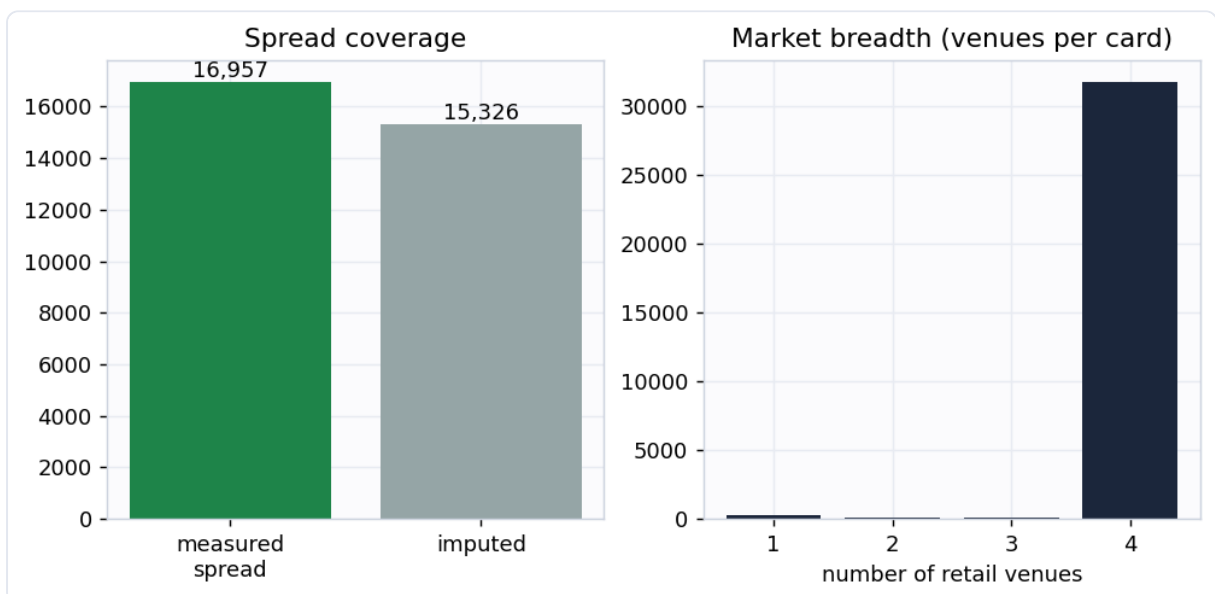

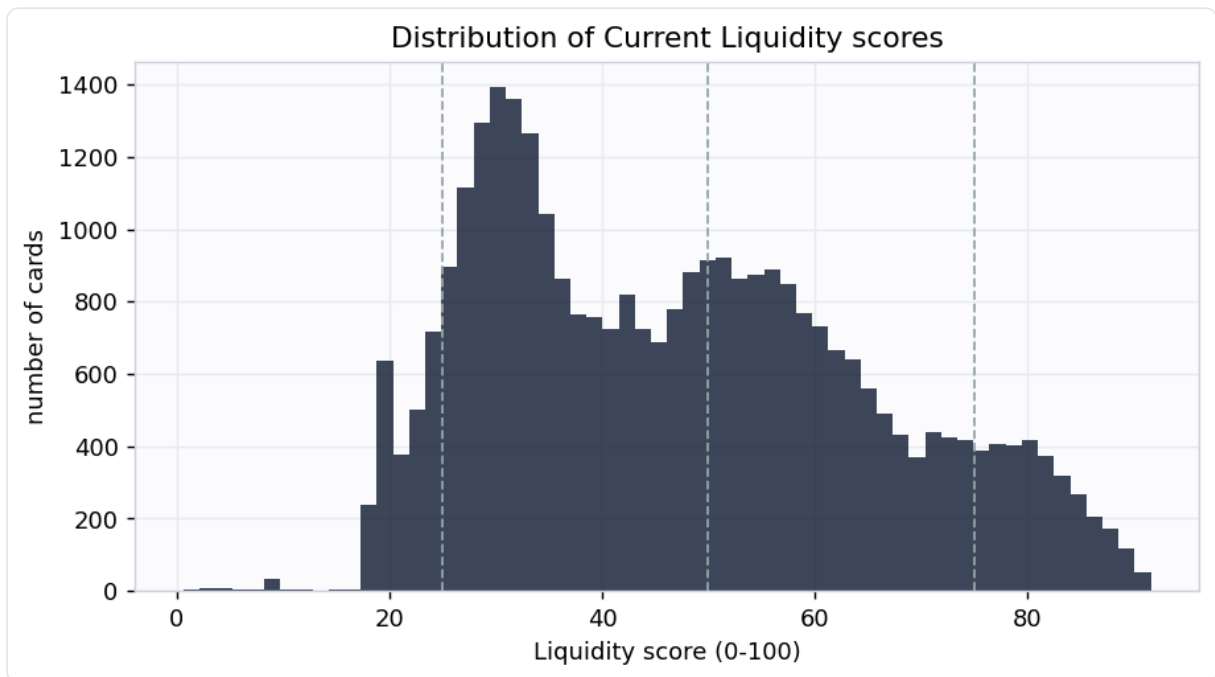

Liquidity is built from four measurable proxies, each normalized to a percentile and blended (weights {'spread': 0.4, 'depth': 0.25, 'activity': 0.2, 'demand': 0.15}):

Component	What it measures	Source
Spread	bid-ask cost to round-trip, CardKingdom buylist vs retail on the same printing	multi-venue price feed
Depth	how many venues list the card, whether a dealer will buy it, cross-venue price agreement	multi-venue price feed
Activity	how often the quoted price actually moves over 120 days (a flat price means nothing is trading)	16-year daily history
Demand	Commander-format popularity (EDHREC)	EDHREC

A card scores high only when it is cheap to exit, sold in many places, actively repricing, and wanted. The weights lean on the spread because that is the cost an owner actually pays to sell.

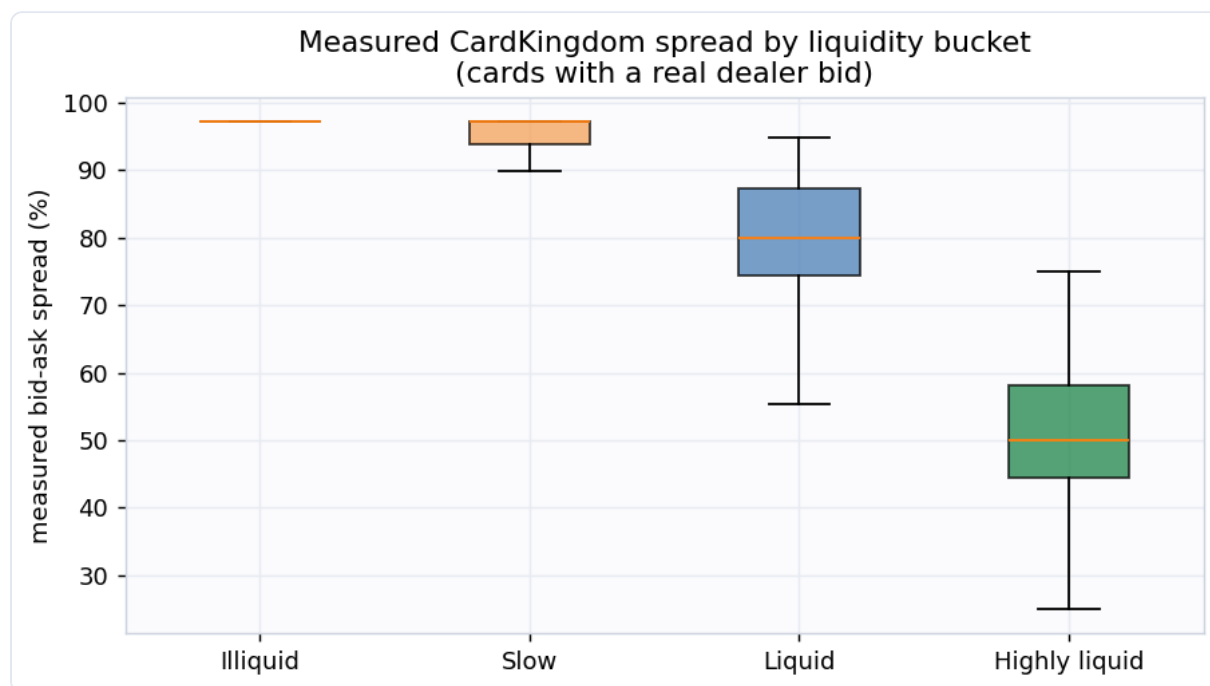

Coverage

Scored **32,283 cards** at this snapshot. **16,957** of them have a real dealer bid (CardKingdom buylist), so their spread is **measured**, not estimated; the median measured spread is **87.2%**. Cards without a dealer bid are flagged `is_imputed` and scored from depth, activity, and demand only.

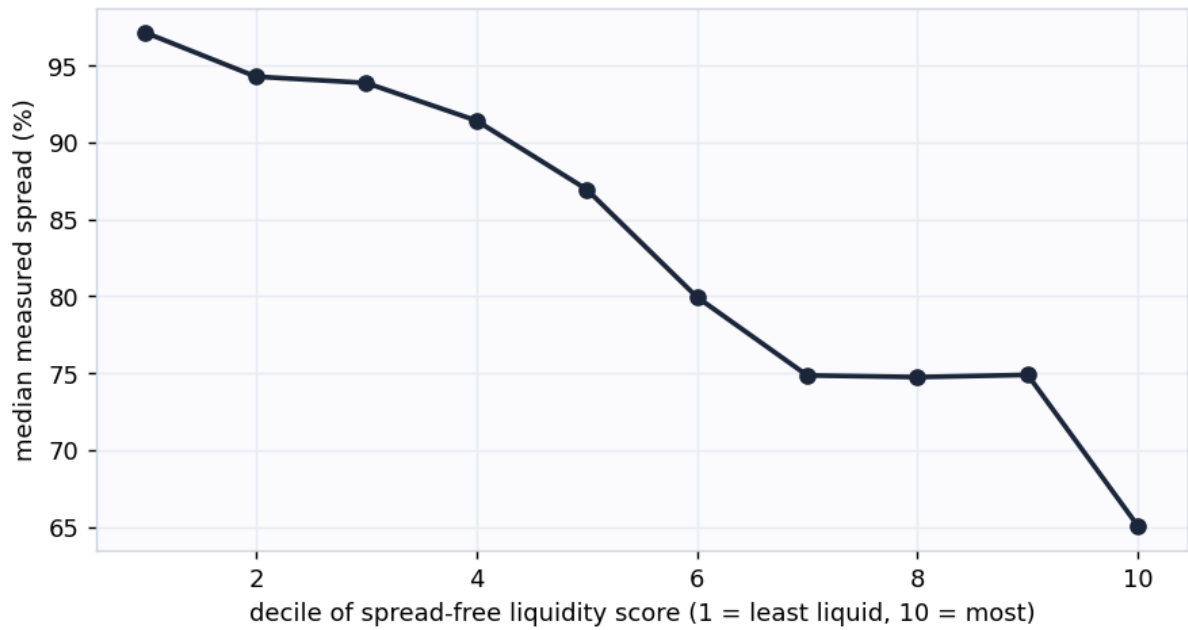

Does the score mean anything? Two honest checks

1. Measured spread lines up with the buckets. Cards the index calls illiquid really do cost more to round-trip. Because the spread is one input to the score, this is partly a consistency check rather than a clean test.

2. Independent proxies predict the spread (the real test). If we rank cards using *only* depth, activity, and demand and deliberately **exclude the spread**, the measured spread still falls steadily as that spread-free score rises (rank correlation **0.473**). The proxies that never saw the spread agree with the spread. That is genuine corroboration, not circular reasoning.

Independent proxies predict the measured spread (spread excluded from this ranking)

Example cards

Example cards (snapshot 2026-07-12)

	Temple Garden score 92 spread 37%	Force of Will score 92 spread 35%	Azusa, Lost but Seeking score 92 spread 35%	Doubling Season score 92 spread 40%	Cavern of Souls score 91 spread 40%
Most liquid	Land — Forest Plains (•••, Add • or ••) As this land enters, you may pay 2 life. If you don't, it enters tapped. The kinkiki was admiring the flowers when the skies darkened, then they ripped up the roots for the next season.	Instant You may pay 1 life and exile a blue card from your hand rather than pay this spell's mana cost. Counter target spell. "Your artillery will burn itself out before I allow my focus to waver."	Legendary Creature — Human Monk You may play two additional lands on each of your turns. "I do not miss Yubai Forest. It is not my home. My home is Kamigata, its people my family. Wherever I set my pack and rest my head, I am home."	Enchantment If an effect would create one or more tokens under your control, it creates twice that many of those tokens instead. If an effect would put one or more counters on a permanent you control, it puts twice that many of those counters on that permanent instead.	Land As Cavern of Souls enters the battlefield, choose a creature type. •• Add •. •• Add one mana of any color. Spend this mana only to cast a creature spell of the chosen type, and that spell can't be countered.
Least liquid (> \$5)	Planeswalker — Bolas Each opponent loses 3 life unless that player sacrifices a nontap permanent or discards a card. Destroy target creature. Draw a card. Nicol Bolas, the Deceiver deals 7 damage to each opponent. You draw seven cards.	Summon Choose any one creature. This turn, all creatures able to block it do so. Innocent by their opponents' wandering staves, even more generals were known to readily lead their troops into battle—often to disastrous defeat.	Creature — Legend Sima Yi has power equal to the number of swap cards you have in play. (This includes both tapped and untapped instant cards.) Sima Yi fought for four generations of the Cao family before his own grandson became emperor and united the three kingdoms.	Legendary Artifact — Equipment Equipped creature has first strike and gets +1/+1 for each instant and sorcery card in your graveyard. Whenever equipped creature deals combat damage to a player, you may cast an instant or sorcery spell from your hand with mana value less than or equal to that damage without paying its mana cost.	Legendary Creature — Phyresian Horror If a source you control would deal noncombat damage to an opponent or a permanent an opponent controls, it deals double that damage to that player or permanent instead. Discard two cards: Put an indestructible counter on Solphim, Mayhem Dominus. • can be paid with • or 2 life.

The most liquid cards are heavily played eternal and Commander staples that sell in minutes at a known price. The least liquid expensive cards are thin-market oddities: no dealer will quote a buy price, and they list in only one or two places.

Buckets

Bucket	Score	Cards	Median measured spread
Highly liquid	75-100	3,101	50.0%
Liquid	50-75	10,757	79.9%
Slow	25-50	15,828	97.1%
Illiquid	0-25	2,597	97.1%

How this plugs into the other signals

Liquidity is a multiplier on every other call. It converts "should I sell" into "can I sell, how fast, at what cost," and it filters out illiquid buy candidates the spike model would otherwise flag. In the toolkit's risk-adjusted value equation, the expected value of a position is discounted by its spread and expected time-to-sale to get a **net realizable** value.

Honest limitations

- This is **version 1: a composite proxy index, not a supervised forecast**. It does not carry a held-out AUC because there is no public ground-truth label for "days to sale."
- There is **no true traded-volume or listing-count data yet**. Spread, price staleness, and venue breadth are stand-ins for depth and velocity. The roadmap adds TCGplayer listing counts and sales velocity (the printing table already carries the join key), which will replace the proxies with measured depth.
- Buylist coverage is CardKingdom-only and United States centric. Cards without a CardKingdom bid have an imputed spread and should be read with that caveat.
- Informational only, not financial advice.
