

mtg-liquidity-signal: the Current Liquidity index

Snapshot 2026-09-13. By Cameraderie Cards. Informational only, not financial advice.

Every existing model in this toolkit tells you *direction*: will a card rise (buy), has it peaked (sell), is it about to be reprinted (brace). None of them tells you whether you can actually **exit**. A perfect sell call is worthless on a card that takes months to move and only at a deep discount. This model fills that gap. It assigns every Magic: The Gathering card a **Current Liquidity** score from 0 to 100: how easily an owner could turn it into cash right now.

What goes into the score

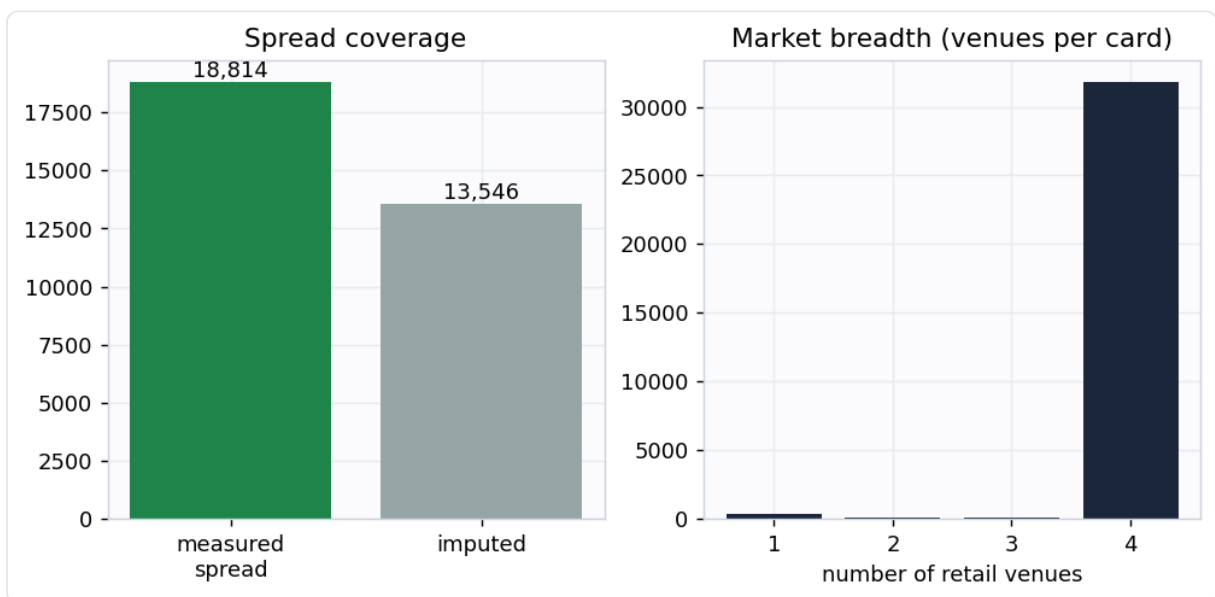

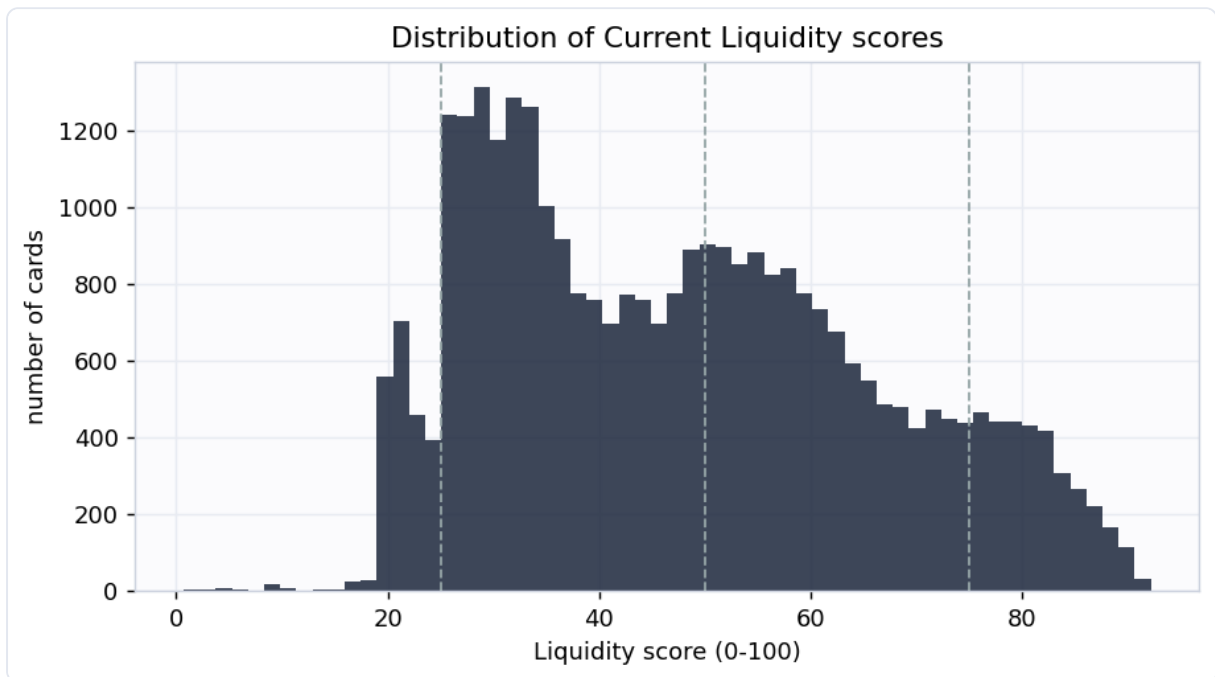

Liquidity is built from four measurable proxies, each normalized to a percentile and blended (weights {'spread': 0.4, 'depth': 0.25, 'activity': 0.2, 'demand': 0.15}):

Component	What it measures	Source
Spread	bid-ask cost to round-trip, CardKingdom buylist vs retail on the same printing	multi-venue price feed
Depth	how many venues list the card, whether a dealer will buy it, cross-venue price agreement	multi-venue price feed
Activity	how often the quoted price actually moves over 120 days (a flat price means nothing is trading)	16-year daily history
Demand	Commander-format popularity (EDHREC)	EDHREC

A card scores high only when it is cheap to exit, sold in many places, actively repricing, and wanted. The weights lean on the spread because that is the cost an owner actually pays to sell.

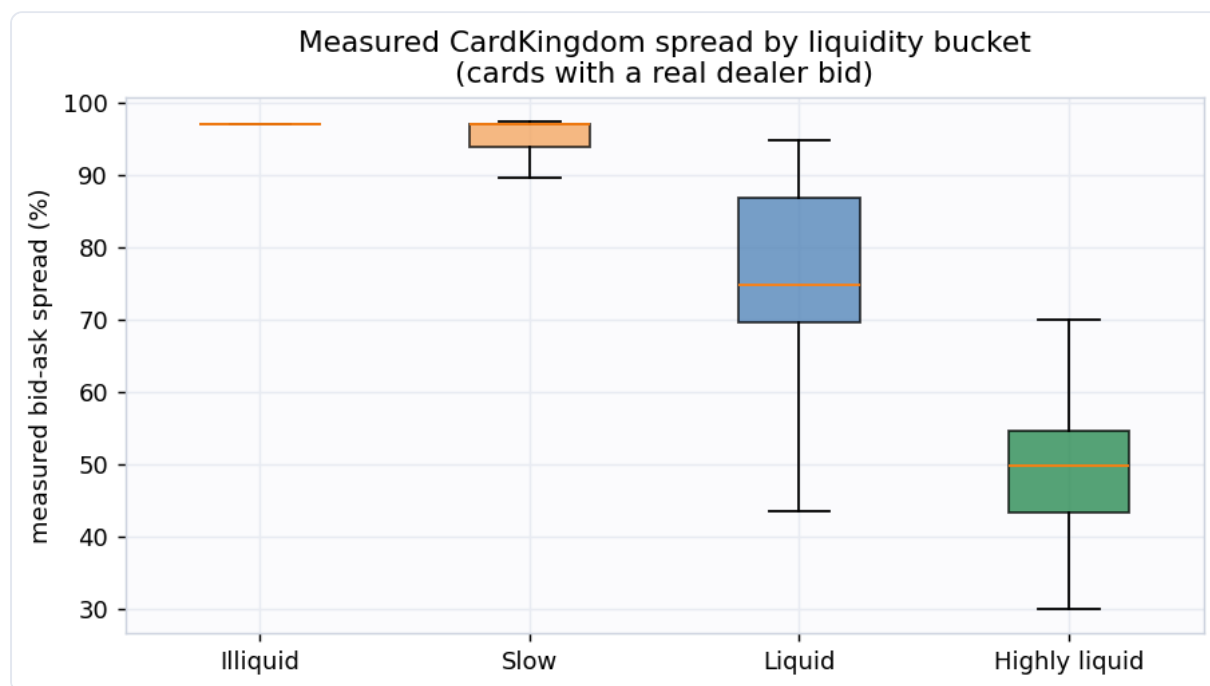

Coverage

Scored **32,360 cards** at this snapshot. **18,814** of them have a real dealer bid (CardKingdom buylist), so their spread is **measured**, not estimated; the median measured spread is **87.0%**. Cards without a dealer bid are flagged `is_imputed` and scored from depth, activity, and demand only.

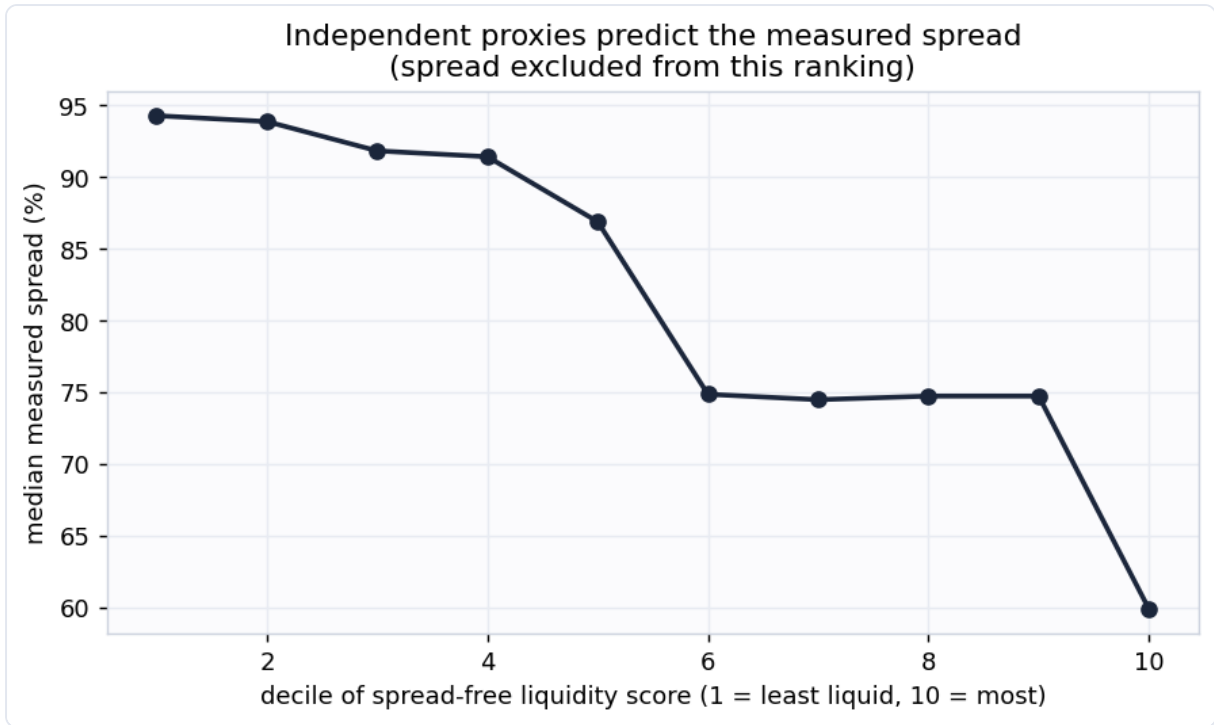

Does the score mean anything? Two honest checks

1. Measured spread lines up with the buckets. Cards the index calls illiquid really do cost more to round-trip. Because the spread is one input to the score, this is partly a consistency check rather than a clean test.

2. Independent proxies predict the spread (the real test). If we rank cards using *only* depth, activity, and demand and deliberately **exclude the spread**, the measured spread still falls steadily as that spread-free score rises (rank correlation **0.465**). The proxies that never saw the spread agree with the spread. That is genuine corroboration, not circular reasoning.

Example cards

Example cards (snapshot 2026-09-13)

	Reliquary Tower score 92 spread 39%	Elvish Mystic score 92 spread 35%	Mana Vault score 92 spread 37%	Ponder score 92 spread 39%	Cavern of Souls score 92 spread 34%
Most liquid	Land You have no maximum hand size. • Add •. Once guarded by the Knights of the Reliquary, the tower stands now protected only by its own tenacious, its diary treasures open to plunder by anyone.	Creature — Elf Druid • Add •. "The Three Rings of the Elves were not made at a moment of war or conquest—that is not their power. Those who made them did not desire strength or domination or horrid wealth, but understanding, making, and healing, to preserve all things unstained." —Elrond	Artifact Mana Vault doesn't untap during your untap step. At the beginning of your upkeep, you may pay •. If you do, untap Mana Vault. At the beginning of your draw step, if Mana Vault is tapped, it deals 1 damage to you. • Add •••.	Sorcery Look at the top three cards of your library, then put them back in any order. You may shuffle. Draw a card. Tomorrow belongs to those who prepare for it today.	Land As Cavern of Souls enters the battlefield, choose a creature type. • Add •. • Add one mana of any color. Spend this mana only to cast a creature spell of the chosen type, and that spell can't be countered.
Least liquid (> \$5)	Planeswalker — Bolas Each opponent loses 3 life unless that player sacrifices a nontap permanent or discards a card. • Destroy target creature. Draw a card. Nicol Bolas, the Deceiver deals 7 damage to each opponent. You draw seven cards.	Legendary Enchantment Artifact Attacking creatures you control have deathrattle. ••••• Choose one — Put a +1/+1 counter on target creature, or Bow of Nylea deals 2 damage to target creature with flying, or you gain 3 life, or put up to four target cards from your graveyard on the bottom of your library in any order.	Legendary Artifact Creature — Robot More Than Meets the Eye ••••• (You may cast this card converted by •••••.) At the beginning of each end step, bolster 1. (Choose a creature with the least toughness among creatures you control and put a +1/+1 counter on it.) When Optimus Prime dies, return it to the battlefield covered under its owner's control.	Legendary Creature — Human Barbarian Melee (Whenever this creature attacks, it gets +1/+1 until end of turn for each opponent you attacked this combat.) If a creature you control attacking would cause a triggered ability of a permanent you control to trigger, that ability triggers an additional time.	Legendary Creature — Elf Noble Arwen, Mortal Queen enters the battlefield with an indestructible counter on it. 1. Remove an indestructible counter from Arwen. Another target creature gains indestructible until end of turn. Put a +1/+1 counter and a lifelink counter on that creature and a +1/+1 counter and a lifelink counter on Arwen.

The most liquid cards are heavily played eternal and Commander staples that sell in minutes at a known price. The least liquid expensive cards are thin-market oddities: no dealer will quote a buy price, and they list in only one or two places.

Buckets

Bucket	Score	Cards	Median measured spread
Highly liquid	75-100	3,422	49.9%
Liquid	50-75	10,862	74.9%
Slow	25-50	15,914	97.1%
Illiquid	0-25	2,162	97.1%

How this plugs into the other signals

Liquidity is a multiplier on every other call. It converts "should I sell" into "can I sell, how fast, at what cost," and it filters out illiquid buy candidates the spike model would otherwise flag. In the toolkit's risk-adjusted value equation, the expected value of a position is discounted by its spread and expected time-to-sale to get a **net realizable** value.

Honest limitations

- This is **version 1: a composite proxy index, not a supervised forecast**. It does not carry a held-out AUC because there is no public ground-truth label for "days to sale."
- There is **no true traded-volume or listing-count data yet**. Spread, price staleness, and venue breadth are stand-ins for depth and velocity. The roadmap adds TCGplayer listing counts and sales velocity (the printing table already carries the join key), which will replace the proxies with measured depth.
- Buylist coverage is CardKingdom-only and United States centric. Cards without a CardKingdom bid have an imputed spread and should be read with that caveat.
- Informational only, not financial advice.
